

QPS

**QUICK
PIT
STOP**

EvoCorse presents a revolutionary racing wheel for fast tyre changes.

QPS: Quick Pit Stop

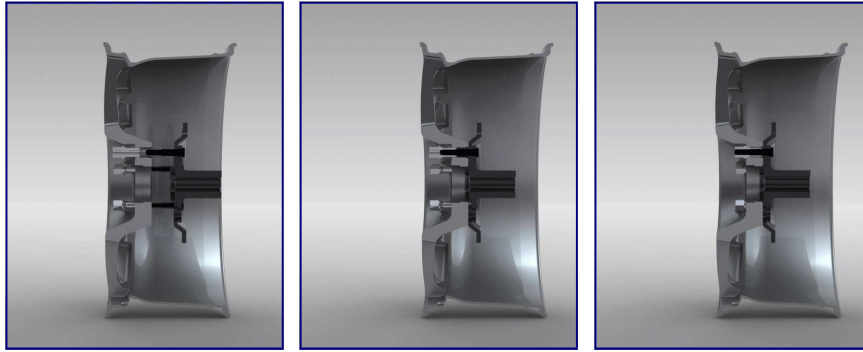

The newly designed QPS system (Quick Pit Stop) allows rapid tyre change operations now even on multi-lock wheels.

This new anchorage system features an advanced concept of nuts, now locked into the rim through its long neck, which slides in and out the housing holes without coming off.

QPS makes tyre changes faster and safer especially on an unpredictable in-stage puncture during a rally.

Numerous tests and simulations proved the extreme efficiency on even the most demanding conditions.

On the sequence above is clear how the newly designed nuts are easily gripping to the studs and never leaving the mounting holes, allowing the fitting of the new wheel simply by directly applying the power of the gun, avoiding manual handling.

Things of the past:

- Wasting precious time screwing nuts on by hand before locking them.
- Nuts falling on the dirt of the ground, getting lost in the mud, snow, grass or sand.
- Risky muddy and dusty threads.
- Handling red hot, messy nuts.

QPS

Wheels are supplied directly with the new QPS System installed

QPS System is patented by *EvoCorse*
